

Question 12.

Name the types of function with reason?

```
function display()  
{  
document.writeln("Named Function");  
}  
display();
```

- **Named:** These types of functions have a name at the time of definition. The function that has been named at the time of definition is known as a named function.

Question 13.

Name the types of function with reason?

```
var display=function()  
{  
document.writeln("Anonymous Function");  
}  
display();
```

- **Anonymous:** These are the functions that doesn't contain any name, the name is declared dynamically at the runtime. An anonymous function doesn't have any name. These types of functions are declared dynamically at the runtime with the help of function operator instead of the function declaration. The reason of using function operator is that it is more flexible than a function declaration. It can be easily replace an expression.
